RDT	Rapid diagnostic test

DEFINITIONS

Antimalarial	Medicines used in the short-term treatment and prevention of malaria. Medicines used solely for the prevention of malaria have been excluded from the analysis of key indicators in this report.
Artemisinin monotherapy	An antimalarial drug with a single active compound, where the active compound is artemisinin or one of its derivatives.
Artemisinin and its derivatives	Artemisinin is a plant extract or synthetic plant extract used in the treatment of malaria. The most common artemisinin derivatives used to treat malaria are artemether, artesunate and dihydroartemisinin.
Oral artemisinin monotherapy	Artemisinin or one of its oral derivatives. These include tablets, suspensions and syrups, but exclude suppositories and injections.
Prequalified artemisinin-based combination therapies (ACTs)	Pre-qualified ACTs comply with the WHO quality assurance policy. A pre-qualified ACT is any ACT that was on the WHO indicative list prior to data collection (see : https://extranet.who.int/prequal/medicines/prequalified/finished-pharmaceutical-products) or previously had C status in a previous Global Fund quality assurance policy. An antimalarial drug that is not WHO prequalified does not necessarily mean that it is not of good quality.
ACTs registered nationwide	ACTs registered with the DPML (<i>Direction de la pharmacie du médicament et des laboratoires</i>), Cameroon's national pharmaceutical regulatory authority, and authorized for sale or distribution in Cameroon. Each country determines its own criteria for including a drug on its national list.
Adult equivalent treatment dose (AETD)	An AETD is the dosage (total number in milligrams (mg)) of an antimalarial drug needed to treat a 60 kg adult (see Appendix).
Booster sample	A "booster" sample was selected by extending the primary sampling unit to a higher administrative unit for sampling certain types of outlets. This extension provided a larger sample size for specific outlets. For this survey, a "booster" sample was selected for pharmacies and pharmaceutical depots. The administrative unit for these types of outlets was extended beyond the arrondissement to the commune. See Appendix 3 for a detailed description of sampling methods.
Cluster	The primary sampling unit, or cluster, for the exit survey. In Cameroon, the cluster was defined as the "health area". This is an administrative unit determined by the Ministry of Health, with a population of around 5,000 to 10,000 in rural areas and 10,000 to 30,000 in urban areas.
Census area	A health area (" <i>zone sanitaire</i> ") where field teams carried out a complete census of all outlets likely to sell anti-malarial drugs.
Monotherapy	An antimalarial drug with a single mode of action. It may be a drug with a single active compound, or a synergistic combination of two compounds with related mechanisms of action.
Point of sale (POS)	Any point of service or point of sale for goods. Points of sale are not limited to fixed outlets and can include mobile units or individuals.
Retail outlets eligible for the study	Outlets received a full questionnaire if they met at least one of the following three inclusion criteria: (1) had one or more antimalarials in stock at the time of the survey; or (2) had one or more antimalarials in stock during the previous three months; or (3) provided blood tests for malaria diagnosis (microscopy or rapid tests) without having antimalarials in stock. Outlets providing services

to specific populations (e.g. the army and military clinics) were excluded from the study.

Dosage/therapeutic regimen	The dosage or administration time and number of doses of an antimalarial drug used to treat malaria. This schedule often varies according to the patient's weight.
Prequalified RDT	Prequalified RDTs are RDTs that comply with WHO quality assurance policy. A pre-qualified RDT is one that was on the WHO indicative list prior to data collection (see https://extranet.who.int/prequal/vitro-diagnostics/vitro-diagnostics-lists).
Artemisinin-based combination therapy (ACT)	An antimalarial drug that combines artemisinin or one of its derivatives with one or more antimalarial drugs from a different class.
First-line treatment	The NMCP recommends a choice of the following molecules as first-line treatment: artemether-lumefantrine (AL), artesunate amodiaquine (ASAQ), dihydroartemisinin piperazine (DHAPPQ) and artesunate pyronaridine (ASPY) for the northern regions, and AL and APYR for the Far North and North regions.
Severe malaria treatment	The WHO recommends intravenous or intramuscular artesunate as first-line treatment in the management of severe <i>P. falciparum</i> malaria. If artesunate is not available, artemether should be used in preference to quinine to treat severe malaria. Rectal artesunate is suitable for pre-referral treatment of children under 6 years of age.
Non-artemisinin treatment	An antimalarial drug that does not contain artemisinin or one of its derivatives.

Sales outlet types

Faith-based/ private not-for-profit health facilities	Faith-based hospitals or clinics run by qualified health professionals registered with the Ministry of Health. A service fee is usually charged.
Private for-profit healthcare facilities	Private hospitals, clinics and diagnostic laboratories operated by healthcare professionals trained and registered with the Ministry of Health. Medical consultations, diagnosis and treatment are provided at cost price.
Pharmacies (Approved pharmacies)	Pharmacies are authorized and regulated by the Direction de la Pharmacie, du Médicament et des Laboratoires (DPML) to dispense health products on prescription and by advice at a commercial rate. They are run by pharmacists and are generally located in urban areas.
General retailers	Grocery stores, stores, mini-markets, kiosks and market stalls selling fast-moving consumer goods.
Itinerant vendors	Mobile vendors generally operate in urban markets. They are not registered with any national regulatory authority.
Wholesalers	ACTwatch Lite has identified a number of officially registered importer-wholesalers. These are large organizations whose official mandate is to import and supply pharmaceutical products to Cameroon. These wholesalers are likely to have a main office in a major city and branches elsewhere in the country.
Other suppliers	Outlets other than importer-wholesalers have played a role in the supply of antimalarials in Cameroon. These were either identified by other outlets as their source of supply, or identified themselves during the outlet survey as suppliers to other types of outlets. These outlets were often pharmacies supplying private non-profit or for-profit health establishments.
Formal sector	In this report, we present some results for the "formal private sector" as a whole. The formal private sector is defined here as the following types of outlets: Faith-based / private not-for-profit healthcare facilities; Private for-profit healthcare facilities and Pharmacies
Informal sector	In this report, we present some results for the "informal private sector" as a whole. The private informal sector is defined here as the following types of outlets: General retailers; and itinerant vendors

INTRODUCTION

This report details the ACTwatch Lite 2024 survey in the Center and Littoral regions of Cameroon. This is the second ACTwatch Lite survey (after the 2023 survey in Benin¹) and the first of its kind in Cameroon.

Cameroon is one of 11 countries that together account for 70% of the global burden of malaria cases and deaths.² Despite a reduction in cases and deaths between 2005 and 2011, these figures have since increased, particularly with the onset of the COVID-19 pandemic. The Global Malaria Strategy 2020 targets call for a reduction in malaria incidence and mortality rates of at least 40% between 2015 and 2020; unfortunately, results for Cameroon have remained unchanged over this period, and malaria remains one of the leading causes of morbidity and mortality, with 6.9 million cases and 15,000 deaths estimated in 2020.³

Cameroon's entire population of 26.8 million is at risk from malaria. Nationwide, one in four children aged between 6 and 59 months tested positive for malaria using a rapid diagnostic test (RDT) during the 2018 Demographic Health Survey (DHS), with malaria prevalence highest in rural areas (32%) and the Center region (47%). The statistics reported for treatment of fever in children in 2018 (61%) were close to the median figures for sub-Saharan Africa for 2015-2019 (69%). However, the figures reported for diagnostic tests (21%) and use of Artemisinin-based Combination Therapy (ACT) in children receiving a diagnostic test (17%) were low compared with regional medians. These results probably reflect the fact that 20% of fever cases in children involved care from informal or traditional sources. Among children with a fever for whom care or treatment was sought, 70% reported care seeking in the private health sector, including informal health facilities.

The private healthcare sector in Cameroon comprises not-for-profit health facilities, for-profit private healthcare establishments (clinics, general practitioner offices), pharmacies (which are registered and licensed by the national regulatory authority, DPML (*Direction de la pharmacies du médicament et des laboratoires*) and informal retailers (known as *street pharmacies* or *officines de la rue*, and largely made up of kiosks and market stalls, with a relatively smaller number of itinerant vendors). The vast majority of private, for-profit healthcare services are located in Cameroon's Center and Littoral regions, home to the country's two largest cities, Yaoundé and Douala. These two regions accounted for 76% (1,930/2,535) of registered for-profit healthcare facilities (DHIS2 Ministry of Health 2020 output), and 95% (38/40) of pharmaceutical distributors listed with DPML in 2019.

Very little data is available on the market for antimalarial tests and diagnostics in Cameroon. Cameroon was not eligible to participate in the Affordable Medicines Facility - malaria (AMFm) and did not participate in the Global Fund's co-payment mechanism for ACTs. Data from the 2018 DHS household survey revealed that among children receiving an antimalarial, quinine in tablet (32%) and injection (11%) form was more common than ACT treatment (21%), and treatment with other non-ACT treatments was common, including SP (9%) and amodiaquine (9%). It is also of concern to note that rectal artesunate (10%) and artesunate injection (13%) were common at a higher level than would be expected for the treatment of severe malaria. The diversity of antimalarial drug classes indicated by DHS 2018 suggests a large and complex market, like those documented in other West and Central African countries through previous ACTwatch surveys. Cameroon's National Malaria Strategic Plan 2019-2023 notes that many unauthorized antimalarials circulate on the market. The current state of the market for malaria diagnosis and treatment in the private sector, and the relevant drivers of market performance, are not fully understood.

ACTwatch Lite (www.actwatch.org) is a pilot research project implemented by Population Services International (PSI) designed to provide timely, relevant and high-quality evidence on the antimalarial market. The Cameroon 2024 ACTwatch Lite is a private sector malaria market study conducted in the Central and Littoral regions using methods adapted from the ACTwatch project.

¹ <https://www.psi.org/publication/actwatch-lite-benin-2023-report/>

² World Health Organization (2021). World Malaria Report 2021

³ President's Malaria Initiative, Malaria Operational Plan 2022

The aim of this study is to provide data that will inform national and global policies, strategies and funding decisions aimed at improving malaria case management. In addition, the project will ultimately develop a standardized toolkit and set of approaches for data sampling, collection and analysis to provide comparable data across countries and over time, which aim to be available and used by other stakeholders wishing to conduct similar studies.

The Center and Littoral regions were selected based on a combination of the relative size of the private health sector and the malaria burden in these locations. Other regions of Cameroon have a higher malaria burden than Littoral (e.g. East: 35%; South: 33%; Adamawa: 32%) but have relatively few health facilities registered in the private sector.⁴ The West region has the third highest proportion of private outlets, but a lower malaria burden.

The report is the first large-scale private-sector malaria market survey of its kind in Cameroon and aims to provide results for indicators including antimalarial drug availability, price and market share, and antimalarial blood test availability and price. The survey collects data on supply chain characteristics, including national, regional and local distribution footprint, surveillance and digital engagement readiness, and digital capacity.

Study design

All formal and informal outlets in the private health sector likely to sell or distribute antimalarials and/or diagnostic tests were approached for participation in the study. Outlets were eligible to be interviewed and audited for antimalarial products if they met at least one of the following three criteria: i) had one or more antimalarials in stock on the day of the survey; ii) had one or more antimalarials in stock in the three months prior to the survey; and/or iii) provided blood tests for malaria diagnosis (microscopy or RDT).

Among wholesalers, the following outlets were approached for inclusion: all pharmaceutical and medical supply companies that wholesaled antimalarial drugs and/or malaria rapid diagnostic tests (mainly to retail outlets) in the three months prior to the survey.

The ACTwatch Lite survey employed a cluster sampling approach used by ACTwatch and other market surveys. The primary sampling approach adopted for point-of-sale surveys is to sample a set of administrative units (geographical clusters) with a corresponding population of around 5,000 to 10,000 in rural areas and 10,000 to 30,000 in urban areas – see appendix for more information. The appropriate administrative unit in Cameroon corresponding to the desired population size is the health area.

A note on the presentation of results in this report:

This document is a comprehensive reference for the 2024 study. Please consult the appendices for more information on the background, design, implementation and data analysis of the study.

Gray text for data appearing in report tables indicates that the estimate provided has been derived from a small N. Specifically, gray text is used to indicate point estimates derived from an N of less than 50 and median prices derived from an N of less than five.

⁴ Global Fund: Funding request form 2020-22

Figure 1 Map of study sites

Figure 2 Survey flow chart

*Identified as outlets likely to sell or distribute antimalarials and/or perform malaria blood tests during census or recall sampling. (Private not-for-profit facilities n=37; private for-profit health facilities n=464; pharmacies n=163; informal sector n=543, distributor n=40)

**Questions were asked to assess the current or recent availability (previous 3 months) of antimalarial drugs and blood tests for malaria (microscopy or rapid diagnostic test).

*** A partial or complete interview was carried out with a sales representative.

SECTION A: KEY RESULTS

This section of the report highlights the main findings of the ACTwatch Lite Cameroon 2024 study.

Table 1 Main results

	Outlets						Wholesalers
	Private not-for-profit facilities ¹	Formal		Formal vendors Total ¹⁺²⁺³	Informal		Wholesalers ^A Total

Abbreviations: RDT, Rapid diagnostic test; ACT, Artemisinin-based combination therapy; AETD, Dosage equivalent for the treatment of a 60kg adult.

* The denominator includes all POS tested, including 84 POS who met the selection criteria for a full interview, but did not complete the full interview (i.e. were not interviewed or only completed a partial interview).

[^] the "distributors" category includes wholesalers, who supply only outlets, and "other suppliers", who are outlets that supply both other outlets and the public.

^Y Prequalified ACTs are products that appear on the WHO prequalified list.

[#] The ACTs approved at national level are those on the Cameroon homologation list.

[±] See appendix for AETD calculations

Figure 3 Market composition: distribution of anti-malarial and diagnostic retail outlets, Cameroon 2024

Among all retail outlets with at least one a) antimalarial or b) malaria diagnostic in stock on the day of the survey

Nearly half (46%) of the private-sector antimalarial outlets identified in the study areas of Cameroon's Central and Littoral regions were general retailers. Private for-profit health facilities accounted for 31% of outlets. Pharmacies accounted for 12% of anti-malarial outlets, while itinerant vendors and church health facilities represented 4% and 7% respectively. The composition of the diagnostic market was mainly made up of private for-profit health facilities (68%), followed by general retailers (15%) and faith-based health facilities (13%). Only 4% of outlets supplying diagnostic tests were pharmacies.

Figure 4 Market composition: breakdown by type of outlet

Among all outlets with at least one antimalarial in stock on the day of the survey

The composition of the anti-malarial market showed a certain variability according to strata. Of the 419 outlets selling antimalarials in Yaoundé, 45% were private for-profit health facilities, 44% general retailers and 9% pharmacies, while faith-based health facilities and itinerant vendors each accounted for 1% of the market. In the city of Douala, of the 183 outlets selling anti-malarial products included, 40% were general retailers, 32% were private for-profit health facilities and 25% were pharmacies.

In the Center region, outside Yaoundé, the informal sector was predominant, with 59% of anti-malarial product outlets being general retailers, and 8% itinerant vendors. Private for-profit and faith-based health facilities accounted for 20% and 9% of the market respectively, while pharmacies accounted for 4%. In the Littoral region outside the city of Douala, private for-profit health facilities were most often cited as stocking antimalarials (38%), followed by pharmacies (27%), general retailers (21%) and church health facilities (14%).

Figure 5 Composition of the diagnostics market, by stratum

Among all outlets with at least one diagnostic test in stock (RDT or microscopy) on the day of the survey

In all four strata, there were fewer outlets selling diagnostics than antimalarials. Private, for-profit health facilities were the most common type of outlet in all four strata (ranging from 84% of the market in Yaoundé to 55% in the Center region outside Yaoundé). Supermarkets accounted for 19% of diagnostic test outlets in Douala, 18% in the Center region excluding Yaoundé, and 12% in Yaoundé. Private not-for-profit facilities accounted for 27% of outlets in the Center region excluding Yaoundé, and 13% in the Littoral region excluding Douala. Pharmacies accounted for 14% of outlets in the Littoral region excluding Douala, but had a negligible presence elsewhere for diagnostic tests.

Figure 6 Number and proportion of private-sector outlets with at least one antimalarial in stock on the day of the survey, by outlet type and stratum

Among all audited outlets

In total, 74% of all outlets audited (N=1207) had at least one antimalarial in stock on the day of the study. The first figure, above, shows the proportion of each outlet type with at least one antimalarial in stock, scaled to the relative proportions of each outlet type in the study. The informal sector and for-profit private health facilities were the most frequent outlets. 69% of informal outlets and 75% of for-profit private clinics had at least one antimalarial in stock. Availability of antimalarials was highest in pharmacies (81%) and church health facilities (92%). We found a non-substantial difference in the availability of antimalarial drugs depending on the stratum studied, with between

70% and 79% of all outlets surveyed having at least one antimalarial drug in stock (in the Center outside Yaoundé and in Yaoundé, respectively).

Figure 7 Availability of ACT products, by type of outlet and stratum

Among all audited outlets

ACTs were available in two-thirds of all outlets surveyed (67%), with the highest availability in Yaoundé (73%) and the lowest in Littoral excluding Douala (64%). Availability of ACTs was highest in pharmacies (80%) and lowest in private for-profit health facilities (59%). Artemether-lumefantrine (AL) was the most commonly available ACT in all outlet types. In general, there were few differences in the availability of the different types of ACT across strata. However, for all types of ATC,

pharmacies tended to have the highest levels of availability, along with ASSP, DHAPPQ, ARPPQ and DHAPPQ-Trim.

Figure 8 Percentage of antimalarial outlets with ACTs in stock on the day of the survey, by outlet type and stratum

Among all audited outlets

Availability of at least one ACT among all outlets surveyed was highest in faith-based health facilities and pharmacies (79% and 80%, respectively) and lowest in private for-profit health facilities and the informal sector (62% and 66%, respectively). Few differences were observed between strata, where ACT availability ranged from 65% in Littoral outside Douala to 73% in Yaoundé.

Figure 9 Percentage of antimalarial outlets with WHO-prequalified ACTs in stock on the day of the survey, by outlet type and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

91% of pharmacies had at least one WHO-prequalified ACT on the day of the survey, while 9% of outlets in the informal sector had a prequalified ACT. On the day of the survey, 49% of outlets in the formal sector as a whole (including private for-profit health facilities, faith-based health facilities and pharmacies) had at least one WHO-prequalified ACT. The Littoral stratum excluding Douala had the highest availability of WHO-prequalified ACTs (46%), while the Center region excluding Yaoundé had the lowest (14%).

Figure 10 Percentage of antimalarial outlets stocking nationally approved ACTs on the day of the survey, by outlet type and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

Pharmacies were the type of outlet where the availability of nationally-registered ATCs (those on Cameroon's approval list) was highest (98%), while 44% and 39% of private for-profit and faith-based health facilities respectively had nationally-registered ATCs. 27% of outlets in the informal sector had nationally-registered ACTs in stock on the day of the survey. The Yaoundé stratum had the highest level of availability of nationally-registered ATCs (57% of all outlets), while the Center stratum outside Yaoundé had the lowest (33%).

Figure 11 Percentage of antimalarial outlets with non-WHO-prequalified ACTs in stock on the day of the survey, by outlet type and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

Availability of non-WHO-prequalified ACTs was high across all outlet types and strata studied. 94% and 86% of outlets in the informal and formal sectors had at least one non-WHO-prequalified ATC on the day of the study. There was no significant difference in availability by geographic region. Overall, 86% of outlets had at least one non-WHO document.

Figure 12 Types of antimalarial drugs audited in private sector outlets, 2024

Among all antimalarial drugs audited, in the private sector as a whole (N = 9269)

ACTs accounted for the majority (80%) of antimalarial products audited in the study, followed by oral quinine (7%) and injectable artemether and artesunate (4% each). AL was the most frequently audited ACT, accounting for 78% of all ACTs. DHAPPQ accounted for 13% of all ACTs found, followed by ASSP (3%).

Figure 13 Percentage of antimalarial outlets with non-artemisinin antimalarials in stock on the day of the survey, by type of outlet and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

Non-artemisinin-based antimalarials were found in the majority of outlets, 81%, 64% and 79% of church health facilities, private for-profit health facilities and pharmacies respectively, on the day of the survey. Artemisinin-free treatments were less commonly available in the informal sector, where 51% of outlets had them in stock on the day of the survey. Availability of non-artemisinin antimalarial treatments varied according to the stratum studied, with the highest availability in the Littoral region outside Douala (66%), and the lowest in Yaoundé (56%).

Figure 14 Percentage of antimalarial outlets with SP in stock on the day of the survey, by type of outlet and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

Sulfadoxine pyrimethamine (SP) is not recommended for the treatment of malaria due to high levels of parasite resistance. It is, however, recommended for the perennial chemoprevention of malaria (CPP). MS was found in the majority (54%) of pharmacies, but less frequently in the other types of outlets included in the study. 20% of informal outlets had SP in stock. 28% and 15% of faith-based and for-profit private health facilities respectively had SP in stock. SP availability was relatively low across regions, ranging from 19% to 30% of outlets with SP available in the Center excluding Yaoundé and Littoral excluding Douala strata, respectively.

Figure 15 Percentage of antimalarial outlets with treatments for severe malaria in stock on the day of the survey, by type of outlet and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

Private not-for-profit facilities and private for-profit health facilities had the highest levels of availability of all outlets with severe malaria treatment (93% and 90%, respectively), while 54% of pharmacies and 34% of informal outlets had severe malaria treatment in stock on the day of the survey.

Rectal artesunate (artesunate suppositories) is part of the WHO-recommended pre-referral treatment for severe malaria in infants. None were found in the Cameroon study. Injectable artesunate and artemether were found in the majority of outlets in the formal sector. Injectable artesunate was found in 72%, 68% and 54% of church health facilities, private for-profit health facilities and pharmacies, while 14% of informal outlets stocked a treatment for severe malaria. Injectable artemether was found in 69%, 68% and 47% of church health facilities, private for-profit health facilities and pharmacies respectively.

Injectable quinine can be used to treat severe malaria in cases where injectable artemisinins are not available or not indicated. It was found in 36%, 51%, 8% and 14% of faith-based health facilities, private for-profit health facilities, pharmacies and informal outlets, respectively.

The Littoral stratum outside Douala had the highest availability of all severe malaria treatments (75%), mainly due to the high levels of availability of injectable artesunate in this area. There was little difference between the other three regions, where severe malaria treatment was found in between 54% and 56% of outlets.

Figure 16 Percentage of antimalarial outlets with oral artemisinin monotherapy, by outlet type and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey

The use of oral artemisinin as monotherapy is not indicated, due to the high risk of treatment resistance. Overall, levels of availability of this product were very low. 6% of pharmacies and less than 1% of informal outlets had this product in stock on the day of the study. In the private sector as a whole, 1% of outlets had oral artemisinin monotherapy in stock. This product was available in 3% of outlets in Yaoundé, 1% in Douala and 0% or almost zero in the other two strata.

Figure 17 Market share of antimalarial drugs

Relative market volume (sales/distribution) of antimalarial AETDs, by type of antimalarial and by sector

In the private sector as a whole, ACTs accounted for 79.5% of market share, with 62% of the volume of product sales reported in the previous week, while DHAPPQ accounted for around 11% of the private anti-malarial market by volume. ASSP and ARPPQ both accounted for around 2% of the anti-malarial market. SP accounted for around 5% of total sales, and artesunate and injectable artemether together represented around 8% of the total market. Oral quinine (included here in the "other" category) accounted for around 8% of total antimalarial sales volume.

Pharmacies held the largest market share of all outlet types (35% of the total), followed by general retailers (29%) and private for-profit health facilities (28%). Private not-for-profit facilities accounted for around 6% of anti-malarial volumes, while itinerant suppliers represented around 2% of total volume. The types of antimalarial drugs passing through the private sector varied according to the type of outlet. 94% of all sales volumes in pharmacies were ACTs (55% LAs, 26% DHAPPQs and 6% ASSPs), with small sales volumes of severe malaria treatment (1%), while private and faith-based health facilities had 15% and 20% of sales volumes of severe malaria treatment (mainly injectable artesunate). In addition, SP accounted for 18% of the volume of antimalarial services provided by private faith-based health facilities. The informal sector, here disaggregated into general retailers and itinerant vendors, mainly supplied ACTs (83% and 90% of their respective sales volumes).

Relative market share by stratum suggests that the Center region outside Yaoundé has the largest market for antimalarials. In particular, oral quinine accounted for 16% of total volumes in this region, but is generally absent elsewhere.

Figure 18 Market share of antimalarial drugs, 2024

Relative market volume (sales/distribution) of antimalarial AETDs, by antimalarial class and type of outlet

Within each study stratum, ACTs accounted for the majority of sales volumes reported the previous week, ranging from 9% in Douala to 70% in the Center excluding Yaoundé. While AL is the ACT with the largest market share (over 59% in all regions), 21% and 16% of all antimalarials distributed in Douala and Yaoundé respectively were DHAPPQs, and 4% of antimalarial volumes in Douala were ASSPs. Injectible artemisinin (artemether/artesunate) are indicated for the treatment of severe malaria. Together, they represent 8% of the total market, but 17% of antimalarial volumes in the Littoral region outside Douala.

Figure 19 Percentage of outlets stocking antimalarials and offering malaria blood tests, by outlet type and stratum

Among all outlets with at least one antimalarial in stock on the day of the survey or in the last three months

Among all private-sector antimalarial outlets, 41% had at least one malaria diagnostic test (RDT or microscopy) on the day of the survey. Private for-profit and faith-based health facilities had the highest levels, with 91% and 90% respectively having a diagnostic test. 13% of pharmacies and informal outlets had diagnostic tests available on the day of the survey. In all types of outlets, RDTs were more commonly available than microscopy. The Littoral stratum, excluding Douala, had a higher availability of diagnostic tests than the other study areas (65% of outlets with diagnostics in this zone, compared with 45%, 32% and 39% in Yaoundé, Center excluding Yaoundé and Douala, respectively).

Figure 20 Market share of blood tests for malaria, 2024

Relative market volume (sales/distribution) of blood tests for malaria by RDT and microscopy, by type of test and by type of point of sale

Overall, the diagnostic market share was split fairly evenly between microscopy (53%) and RDTs (47%). Private, for-profit health facilities held the largest market share for diagnostic tests, accounting for 79% of the total private sector market, followed by faith-based health facilities (16%). Less than 1% of diagnostic test volumes passed through pharmacies.

Figure 21 Market share for RDTs, by manufacturer

Among all outlets offering diagnostic tests

The three most frequently audited RDT manufacturers were Abbott, Orchid and Arkray, with an overall market share of 20%, 27% and 28% respectively.

Figure 22 Declared price of malaria microscopy, by type of outlet

Among all outlets performing microscopy

The median cost of malaria microscopy for an adult or child showed little variability and was the same in all outlet types reporting these data, at 1000 FCFA [interquartile range: 1000; 1000].

Figure 23 Median price for equivalent doses of adult antimalarial treatment (AETD) in the private sector

Among all tablet formulations of ACT without quality assurance (non-prequalified ACT), ACT with quality assurance (prequalified ACT), sulfadoxine-pyrimethamine (SP), oral quinine and chloroquine available in the private sector, in CFA francs

Median prices per AETD (adult equivalent treatment dose) for WHO-prequalified ACTs and non-WHO-prequalified ACTs across the private sector were very similar (3300 FCFA and 3000 FCFA, respectively). Median prices for non-ACTs varied according to product type, ranging from 5204 FCFA per AETD of oral quinine to 998 FCFA for chloroquine and 500 FCFA for SP.

Figure 24 Median private-sector price of prequalified adult equivalent treatment dose (AETD) ACTs and prequalified pediatric pre-packaged ACTs (PP ped AL prequal), 2024

Among all tablet formulations of SP, prequalified ACT (for an adult) and PP ped QA AL (treatment for a child from 5 to 15 kg), available in the private sector, by type of point of sale, in CFA francs

The median price of antimalarial treatments varied to some extent according to the type of outlet. The price of a packet of WHO-prequalified AL to treat an infant weighing between 5 and 15 kg ranged from 500 FCFA in pharmacies and the informal sector to 1220 FCFA in for-profit private health facilities, for example. Non-WHO prequalified pediatric ACTs had a higher median price than WHO prequalified equivalents, but were cheaper for adults. The median price of a SP AETD remained lower than that of pre-packaged ACTs in all outlet types. Median prices for RDTs were consistent across all types of private-sector outlets (1000 FCFA) and were significantly cheaper than WHO-prequalified ACTs for adults (2900 FCFA).

Figure 25 ACT recommendations by service provider, by type of outlet

Among all providers who completed the interview and answered this question (N=992)

Providers participating in the study were asked about their knowledge of malaria treatment. More than half of private-sector providers said they would recommend ACTs to treat uncomplicated malaria, for both adults (61%) and children (57%). The proportion was highest in pharmacies (83% and 80% for adults and children) and lowest in the informal sector (54% and 49%). Around half of care providers in private, for-profit health facilities said they would recommend the use of ACTs for uncomplicated malaria in adults (57%) and children (53%), while 54% of providers in these facilities rated ACTs as the most effective treatment recommended by the government.

Figure 26 Knowledge of RDTs among providers, by type of outlet

Among all providers who completed the interview and answered this question (N=992)

RDTs were known, with 91% of all providers reporting that they had heard of an RDT (ranging from 100% of faith-based providers to 83% of informal sector providers). However, only 59% of providers had ever used an RDT with a client, ranging from 98% for faith-based providers to 25% for pharmacy providers.

Figure 27 Provider would recommend an antimalarial to a customer with a negative malaria blood test, by type of outlet

Across all private-sector outlets, around a third of providers said they would sometimes (31%) or always (4%) provide malaria treatment in the event of a negative test result. This proportion was higher in private for-profit health facilities (45%; 6%) than in other types of outlets.

Figure 28 Circumstances evoked for antimalarial treatment of a customer with a negative test, by type of outlet

Among providers who responded that they would sometimes or always treat a negative test (N=487)

Among providers who said they would sometimes or always treat malaria in the event of a negative test result, the most frequently cited reason was the case of the client showing malaria symptoms (cited by 88% of providers). Other reasons included clients requiring treatment and providers not trusting the test result.

Figure 29 Proportion of outlets with access to operational technology, by outlet type

Among all providers who completed the interview and answered this question (N=989)

The study collected data on the proportion of outlets with available and functional technology as a measure of current or future ability to engage with digital technologies. Overall, 74% of outlets had a partial power supply on the day of the study, 68% had a working phone (mobile or other), 39% had functional and available Wifi, and 61% had a working laptop or tablet. Overall, pharmacies were the most likely to report having access to these technologies, and the informal sector was the least likely to do so.

Figure 30 Percentage of outlets currently using digital technology, by outlet type

Among all providers who completed the interview and answered this question (N=989)

Pharmacies were the most likely to report ever having used a digital tool to manage sales (89%), inventory (89%), supplier orders (93%) and to pay their suppliers (58%). Lower levels were observed in faith-based and private for-profit health facilities. The informal sector reported the lowest level of use of digital tools.

Figure 31 Participation in point-of-sale malaria surveillance system, malaria surveillance, recording and reporting frequency, by type of outlet

Among all formal sector providers who answered this question (N=664)

Participation in malaria surveillance systems varied considerably according to outlet type (it should be noted that these data were only collected for outlets in the formal sector). 94% and 73% of private not-for-profit and faith-based health facilities respectively declared that they reported malaria data, mostly in monthly activity reports. More than half of private not-for-profit facilities (56%) and around half of for-profit private facilities (48%) reported to DHIS2. Very few pharmacies (4%) provided data. In the formal sector as a whole, only 4% of outlets reported having received an official visit in the previous 6 months, while 16% of all outlets reported using a malaria checklist.

Figure 32 Point-of-sale licenses and inspections, by type of outlet
Among all formal sector providers who answered this question (N=664)

The type of permits and inspections reported or observed at each outlet varied according to outlet type. These data were only collected for outlets in the formal private sector. Private not-for-profit facilities reported having been subject to government inspection (71%), while 38% of pharmacies reported the same.

Figure 33 Type of training received by the provider, by type of outlet

Across all outlet types, in both the formal and informal private sectors, the most common training received in the last six months was on malaria surveillance (41% overall, 25% in informal outlets and 58% in formal outlets). At the same time, 24% of pharmacies reported having received training in malaria treatment in the last 6 months, and 15% of private for-profit and private not-for-profit facilities reported having received training in malaria diagnosis.

Figure 34 Location of sales outlet customers, by service provider

The location of customers most often reported by suppliers for all types of formal private sector outlets was the immediate community in which the outlet was located (94% reported this), while 55% of pharmacies reported having customers in neighboring communities in the same region. 22% of pharmacies reported having customers from other regions of Cameroon.

Figure 35 Percentage of formal sector outlets selling online or wholesale (N=664)

A very small percentage of distributors reported selling anti-malarials wholesale or online. In the formal private sector as a whole, less than 1% reported distributing anti-malarials online or wholesale to other outlets. 2% of faith-based health facilities reported selling anti-malarials wholesale.

Figure 36 Type of suppliers used by outlets, by sales outlet

We asked providers about their sources of antimalarial products. Among faith-based facilities, the most common source was faith-based non-profit suppliers (73%). Among private for-profit facilities, the most common sources were wholesalers/importers (58%) and public supply chains (45%). Among pharmacies, the most common source was wholesalers/importers (reported by 100% of pharmacies).

Figure 37 Market volatility by provider in formal outlets

When asked about the volatility of antimalarial drug prices over the past six months, the majority of formal sector providers indicated that prices had remained broadly stable. Around 20% of all private-sector providers reported having changed antimalarial supplier in the previous six months.

Figure 38 Distribution of dose forms by type of antimalarial audited during the survey

Overall, tablets were the most common dose form (>60%) among antimalarials, followed by suspensions (19%), with DHA-PPQ (42%) and AL (29%) predominating among ACTs. Liquid and injectable powder forms were respectively predominant in the artemether (90%) and artesunate (94%) groups.

Figure 39 Distribution of dose forms of ACT by type of outlet during the survey

The dose form most frequently used by ACTs at point of sale was the compressed form (75%), followed by the suspension form (24%). There were no variations by type of outlet

SECTION B: THE PRIVATE SECTOR SUPPLY CHAIN IN CAMEROON

To practise as a pharmacist in Cameroon, you must be registered with the Ordre National des Pharmaciens. Under current legislation, pharmacists have a monopoly on the preparation, importation, possession, use, wholesale and retail sale, and public dispensing of medicines, medicinal plants and all other pharmaceutical products listed in the pharmacopoeia.⁵ Local drug production remains embryonic and uncompetitive. Local manufacturing units (17) cover less than 5% of national needs.

The pharmaceutical sector in Cameroon is divided into 2 sub-sectors: private and public. The organization of the public pharmaceutical sub-sector is based on that of the 3-level health system: central, intermediate and peripheral. It includes: the Centrale Nationale d'Approvisionnement en Médicaments et consommables médicaux Essentiels (CENAME), the Fonds Régionaux pour la Promotion de la Santé (FRPS), health programs, public health facilities, international vaccination centers, border health posts, and approved wholesale pharmaceutical distribution outlets.

The private pharmaceutical sub-sector can be broken down into two main categories: private for-profit (licensed local pharmaceutical manufacturing establishments, wholesale distribution establishments and pharmacies) and private not-for-profit (faith-based central purchasing agencies). Few data are available to explicitly explain the supply chain system for antimalarials and RDTs in the private sector in Cameroon.

One of the aims of the ACTwatch Lite study was to assess the structure of the supply chain for antimalarials and RDTs in the private sector, in terms of the distribution networks of importers, national and local wholesalers and their joint distribution practices.

To achieve this objective, we approached private-sector pharmaceutical wholesaler-importers registered on the approved list of the DPML of the Ministry of Health, importing antimalarials and/or RDTs, and headquartered in the Center and Littoral regions. We selected 21 importing wholesalers on a purposive basis, in order to obtain a range of sizes and organizational perimeters. We carried out 20 of the 21 interviews and reached saturation point.

A semi-structured thematic guide was developed based on the concepts of the analytical framework, and was used to ask participants to discuss their practices in relation to stocking antimalarials and RDTs, pricing antimalarials and RDTs, distribution network and practice, competition, sources of information, sales revenue, and regulation. Using a thematic analysis approach, all interview notes were read to identify the main themes or experiences. An initial coding structure was developed based on the analytical framework and existing literature, then applied to the interview notes and revised as the analysis progressed by adding additional codes and sub-codes to capture as many nuances in the data as possible. Coding and thematic analysis were carried out using Dedoose software version 9.2.12. Information from these in-depth interviews was supplemented by a review of relevant documents on malaria control regulations and policy.

⁵ Ministry of Public Health. Plan stratégique pour le renforcement de la chaîne d'approvisionnement publique des produits de santé au Cameroun : 2022-2026, March 2022 : 93

We present here the main results of this analysis. In all, we were able to carry out 20 interviews out of the 21 importing wholesalers approached (95%). Only one interview could not be recorded. Almost all the importing wholesalers interviewed (90%, 18/20) imported anti-malarial drugs. Only one of the importing wholesalers reported having imported RDTs only once since opening (5%, 1/20). Figure 40 shows the semantic co-occurrence matrix for the main themes discussed during the interviews. It can be seen that regulations and challenges were much more developed by importing wholesalers.

Figure 40 Matrix of semantic co-occurrence of supply chain themes

Anti-malarial drug storage

The main document required to import antimalarial drugs into Cameroon is the Marketing Authorization (MA). The majority of importing wholesalers (71%) stated that they had no exclusive import agreement with laboratories. Such an agreement would be contrary to the code of deontology, and would not be possible for importers of generic forms. The main factors in the choice of laboratories by importing wholesalers were professionalism (up-to-date authorizations), value for money and commercial advantages. Import lead times varied between 2 and 6 months, from the time the order was placed, through manufacturing, transport, collection and customs clearance, to the time the product left the port. The main factors influencing import lead times were :

- slowness in obtaining regulatory approvals
- raw material shortages impacting manufacturing times
- transport times (sea vs. air)
- remittances

The main criteria for choosing which antimalarial drugs to import/store were based on demand (which antimalarial drugs were most in demand) and the commercial advantages offered by the laboratories (promotion, possibility of deferred payment). Storage, operation and distribution are regulated by Cameroon's Good Distribution Practice guidelines. Importing wholesalers are required to hold a certificate of good distribution practice issued by the DPML, and periodically renewed after evaluation.

Setting sales prices for anti-malarial drugs

The procedure for setting sales prices for anti-malarial drugs could not be developed in detail, given the great variability in the answers given by importing wholesalers. However, it is clear that the approved pre-tax price is set at the time of application for market authorization. The selling price is calculated on the basis of the purchase price multiplied by a coefficient defined by the regulatory authorities. The main factors influencing the selling price reported by wholesalers were :

- order volume, which may lead to discounts,
- costs associated with the import process (transport logistics, tax and customs duties),
- the type of sales outlet (different session prices for wholesalers versus retailers),
- commercial advantages with the manufacturing laboratory,
- internal company costs (payroll, fuel),
- inflation and currency fluctuations (dollar purchases).

Distribution network and practices

Figure 41 below shows a diagram of the antimalarial supply chain in the private sector in Cameroon. In the private sector, importing wholesalers mainly supplied pharmacies (84%) and for-profit health establishments (68%). Tacit agreements between importing wholesalers were also reported, enabling them to supply each other in the event of a stock shortage at a fellow wholesaler (21%). More sporadically, importing wholesalers were able to distribute to regional funds (31%) and first- and second-rate public hospitals (21%).

Distribution frequency was daily or even twice-daily in the major cities (Douala and Yaoundé) for the majority of importing wholesalers. Weekly or monthly deliveries were more common in regions outside the big cities, depending on distance. All ten (10) regions of Cameroon are covered by importing wholesalers, although coverage is weaker in the North and Far North regions. The majority of deliveries to retailers are handled by wholesalers themselves (79%). However, around half also use third-party deliveries (47%), in particular "approved" agencies for long-distance deliveries and deliveries to security risk areas. Occasionally, some retailers collect anti-malarial drugs themselves, in case of emergency. Transport costs are generally borne by the wholesaler, but may rarely be invoiced to the customer if a third party is called in.

Almost all importing wholesalers stated that they did not require a minimum quantity for distribution (95%), but that customer orders were generally substantial. Group deliveries are preferred by wholesalers to minimize transport costs. Wholesalers also offer flexible payment terms.

Competition

Wholesalers reported competing with each other, with the notion of a monopoly held by two large wholesalers. The informal sector is reported to be the second biggest competitor. The marketing

strategies used by wholesalers include the use of medical representatives, advertising of new arrivals, stock availability, quality of service, promotional campaigns (trade discounts) and rapid delivery times.

There are no agreements between wholesalers, neither commercial nor on prices, nor on the distribution of regions or towns. However, there is a non-commercial association of wholesalers (Association des grossistes pharmaceutiques du Cameroun) where they discuss the difficulties facing the corporation.

Information sources

The majority of importing wholesalers' main sources of information were drug manufacturers and medical representatives. Medical representatives are more responsible for collecting information on product rotations and the challenges faced by customers. Secondary sources of information were the association of pharmaceutical wholesalers in Cameroon, the order of pharmacists, the Ministry of Health, and secondarily the Internet (google). The most reported communication channels used were online discussion forums (WhatsApp and others).

Sales revenue

The sales period with high revenues generally corresponded to the rainy season (April-September), with a peak reported in September (corresponding to the start of the school year, return from vacations). Sporadic peaks were also reported during the winter period (November-December). The sales period with reported low incomes was January and February. Sales periods with high revenues varied enormously according to antimalarial brand, prescribers and availability. Promotional campaigns were also reported as factors impacting high sales of antimalarials. The contribution of antimalarials to the total income of importing wholesalers ranged from 12% to 80% (median: 35%).

Regulations

Regulations exist on distribution, pricing, profit margins, taxation and customs formalities. The majority of importing wholesalers (71%) feel that regulatory requirements are reasonable overall (not too challenging to open, frequent controls/inspections, ease of communication). However, they point to significant challenges that could be improved, chiefly the administrative slowness in issuing authorizations (provisional/final technical visa; renewal of certificate of good practice, import policies). These challenges have an impact on companies in terms of i) collection times, with stock-outs and/or product expiry; ii) difficulties in paying expenses (salaries, etc.) and iii) trust between the laboratory and the wholesaler.

Almost all respondents (82%) stated that the regulatory authorities had the capacity to enforce sanctions in the event of non-compliance, and that the application of sanctions was very strict. The main change desired by importing wholesalers during the interviews was the shortening of the time required by the regulatory authorities to issue administrative authorizations. There was also a desire to step up the fight against the informal sector.

All the wholesalers said they had no details of how the informal market operated. However, they reported that many efforts were being made by the Ministry's authorities, but that the informal sector was still predominant.

* AETD - Adult Equivalent Treatment Dose - is the number of milligrams needed to treat a 60 kg adult (see appendix 9: AETD).

Information provided by the respondent on the price of a specific quantity of antimalarial (e.g. price per tablet or price per pack) has been converted into a price by AETD

Percentage profit margins are calculated as the percentage difference between the reported wholesale purchase price and the retail selling price for each product. Only products with non-missing wholesale and retail prices were included.

Products with missing margin data for the following products: Anti-malarials: 6114

Here we present the median difference as a percentage.

* AETD - Adult Equivalent Treatment Dose - is the number of milligrams needed to treat a 60 kg adult (see Appendix 9: AETDs).

Information provided by the respondent on the price of a specific quantity of antimalarial (for example, price per tablet or price per pack) has been converted into a price by AETD.

Number of products for which sales volume data are missing for the previous week in - Yaoundé: 1458; Center excluding Yaoundé: 149; Douala: 895; Littoral without Douala: 298

APPENDICES

APPENDIX 1 ACTWATCH LITE: PROJECT OVERVIEW

ACTwatch Lite has been designed to provide relevant, high-quality data on the private market for antimalarial drugs. The purpose of this data is to inform and improve the policies and strategies of national and international malaria control programs, and to guide their policy, strategy and funding decisions to improve malaria case management.

Over the past two decades, numerous investments and interventions at regional and international level have positively influenced the private sector market in malaria-endemic countries, particularly in sub-Saharan Africa. Among the direct interventions that have impacted this private sector, the most illustrative was the Affordable Medicines Facility-malaria (AMFm) initiative launched in 2010 and extended as a private sector co-payment mechanism by the Global Fund until 2017. Despite the positive results of these interventions, the adoption of policy and action at national level to involve the private health sector market in malaria case management has not progressed enormously since the AMFm era. One of the main factors limiting progress in this sector is the lack of up-to-date, robust data on malaria case management, including inputs, in the private market sector. This data can be used by public health stakeholders and policy-makers at national level to support the design of appropriate interventions.

Between 2007 and 2016, the ACTwatch project collaborated with Ministries of Health in 13 African and Southeast Asian countries to conduct over 50 malaria market surveys. These surveys provided nationally representative data on the availability, price and market share of antimalarial products in the public and private health sectors. In collaboration with the World Health Organization (WHO) and with funding from the Bill & Melinda Gates Foundation, PSI has implemented a new market survey in 2023 on antimalarial drugs and diagnostic tests in the private sector in Benin, Cameroon and Nigeria (ACTwatch Lite). This study will provide a WHO-approved toolkit which, combined with appropriate advocacy, will catalyze support for the adoption of ACTwatch Lite methods in other countries.

Successful implementation of ACTwatch Lite will provide national malaria programs and their partners with an up-to-date understanding of national malaria private sector markets, with which to 1) understand the drivers of market performance and target areas and channels of intervention; 2) inform national and sub-national decision-making; 3) contribute to the development of Global Fund concept notes and other funding opportunities.

APPENDIX 2: NATIONAL CONTEXT CAMEROON

The malaria situation in Cameroon

Cameroon is one of 11 countries that together account for 70% of the estimated burden of malaria cases and deaths worldwide. Despite numerous efforts in the fight against malaria with a stable reduction between 2005 and 2011, the number of malaria cases and deaths has increased slightly since 2015. The 2017 report by the National Malaria Control Program (PNLP), shows that the number of malaria cases recorded in the country's health facilities evolved from 1,829,266 to 2,093,009, an increase of 14.4% while the number of all-cause consultations rose from 5,957,438 to 8,622,922, an increase of 44.7%. The incidence of malaria in Cameroon in 2017 was 86.3 cases per 1,000 inhabitants. It is highest in the forest zone covering the East, South-West and Center regions, and moderate in the other regions.

Parasite prevalence among children aged 6 to 59 months was 30% for the country as a whole (EDS-MICS, 2011). However, there is a regional disparity. It is high in the country's forest zone, notably the Center (excluding Yaoundé) (52.4%), East (48.2%), South-West (46.1%), South (43.1%), the Sudano-Sahelian zone of Adamaoua (47.4%) and the North (34.3%). However, it is relatively low in the western highlands (26.8%), the northwest (15.0%), the Sahelian Far North (27.1%) and the major urban centers of Douala (12.1%) and Yaoundé. From 2011 to 2017, proportional hospital morbidity due to malaria fell from 30.7% to 24.3%, a relative drop of 21% (NSP 2021-2023). Among pregnant women, after a slight decline from 2011 to 2012, morbidity increased from 2013 to 2017, rising from 12.7% to 21.3%. However, the systematic screening of pregnant women for malaria carried out in the prenatal consultation departments of health facilities, since the scaling-up of the use of rapid malaria diagnostic tests in 2014, has contributed to a significant increase in the number of malaria cases in pregnant women (diagnosis of cases of plasmodium infection with or in the absence of fever)

The State of Cameroon has made political commitments and taken concrete action to reduce the burden of malaria: Adherence to the global "Roll Back Malaria" initiative launched in 1998; Adherence to the Abuja Summit Declaration in April 2000; Reorganization of the National Malaria Control Program in 2002 to make it a priority health program; Integration of malaria control into the Health Sector Strategy (2016-2027) and the National Health Development Plan (PNDS) 2016-2020; the adoption of several national policies to improve access to quality malaria prevention and treatment services (free malaria treatment for children under 5; free intermittent preventive treatment for pregnant women; free distribution of long-acting impregnated mosquito nets to the entire population; integration of malaria control services into the Universal Health Coverage reform currently under development, etc.). (PSNLP, 2019)). These measures have led to a reduction in hospital morbidity due to malaria, particularly in the under-5 age group. It fell from 45.8% in 2011 to 31.8% in 2017 (NSP 2021-2023). This reduction is attributable to all the actions undertaken by the government and its partners in favor of this vulnerable group (free treatment of simple and severe malaria since February 2011 and May 2014 respectively, free distribution of LLINs to children under 5 since 2005, chemoprevention campaign for seasonal malaria in children aged 3 to 59 months in the Far North and North Regions).

According to the President's Malaria Initiative Operational Plan 2022, between 2017 and 2020, the number of malaria cases in Cameroon rose by 3.8%, from 250 to 260 per 1,000 inhabitants at risk. During the same period, WHO notes that the mortality rate rose slightly by 0.8%, from 0.55 to 0.56 per 1,000 inhabitants at risk. Less than 30% of children with fever had a positive malaria test in 2022 (MIS, 2022). Thus, the percentage of children aged 6-59 months who tested positive for malaria using the rapid diagnostic test was 26.1% nationally, 49.1% in the Center (excluding Yaoundé (10%)) and 27.8% in the Littoral (excluding Douala (6.9%)). The Global Malaria Strategy 2020 targets call for a reduction in malaria incidence and mortality rates of at least 40% between 2015 and 2020. Unfortunately, results for Cameroon have remained relatively unsatisfactory over this period, and malaria remains a major cause of morbidity and mortality, with 6.9 million cases and 15,000 deaths estimated in 2020.

The entire national population, i.e. 26.8 million people, is exposed to the risk of malaria every year. Nationally, one in four children aged between 6 and 59 months tested positive for malaria by rapid diagnostic test (RDT) in the Demographic Health Survey (DHS 2018), with malaria prevalence highest in rural areas (32%) and in the Center region

(47%). Reported levels of access to treatment for childhood fever in 2018 (63%) were close to the 2015-2019 medians for sub-Saharan Africa (69%). However, the reported proportion of RDT use (21%) and artemisinin-based combination therapy (ACT) use among children who received a diagnostic test (17%) were low compared with regional medians. These results probably reflect the fact that care was sought from informal and traditional sources for 20% of suspected cases, and from pharmacies for 12% of suspected malaria cases. Of the feverish children for whom care or treatment was sought, 70% did so in the private health sector, including informal stores.

Recommendations for malaria case management

To reinforce the fight against malaria, the government has drawn up guidelines for the management of malaria cases, set out in a document entitled *Guide de prise en charge du paludisme*. These diagnostic guidelines call for systematic confirmation of all suspected cases by a rapid diagnostic test (RDT) or by high-quality microscopy. RDTs are subsidized and free for children under five. The performance of RDTs and microscopy must be supported by an operational Quality Assurance and Quality Control system. With regard to treatment, the guide identifies a specific protocol for each of the seven categories identified, namely: (i) uncomplicated malaria, (ii) clinical failures, (iii) severe malaria: pre-referral treatment, (iv) severe malaria, (v) malaria in pregnant women, (vi) special populations and situations, and (vii) Intermittent Preventive Treatment in pregnant women.

Private healthcare system

The for-profit private healthcare sector in Cameroon comprises private for-profit establishments, pharmacies that are registered and licensed by the national regulatory authority, the *Direction de la pharmacie du médicament et des laboratoires (DPML)*, and informal retailers, known as street pharmacies or street dispensaries, and comprising mainly kiosks and market stalls, with a relatively smaller contingent of itinerant drug vendors. Private, for-profit health services are overwhelmingly located in Cameroon's Center and Littoral regions, home to the country's two largest cities, Yaoundé and Douala. These two regions comprised 76% (1930/2535) of registered for-profit healthcare facilities (Ministry of Health 2020 list from DHIS2), 61% (267/436) of Ubipharm network pharmacies, and 95% (38/40) of pharmaceutical distributors listed with DPML in 2019.

APPENDIX 3: SURVEY METHODS

Population design and study

ACTwatch Lite is a cross-sectional survey of retail outlets. The study population is defined as all outlets likely to sell or distribute antimalarial drugs and/or provide malaria blood tests. In Cameroon, this includes the following types of outlets private for-profit and not-for-profit health facilities (faith-based health facilities), pharmacies, pro-pharmacies, general retailers, itinerant vendors and wholesalers.

Eligibility criteria

Outlets were eligible for a supplier interview and antimalarial product audit if they met at least one of the three study criteria: 1) one or more antimalarials apparently in stock on the day of the survey; 2) one or more antimalarials that would have been in stock during the three months prior to the survey; and/or 3) performs blood tests for malaria (microscopy or RDT).

Sampling

The study adopted a cluster sampling approach. This involved sampling a set of administrative units (geographical clusters) with a corresponding population of around 10,000 to 15,000 inhabitants. The appropriate administrative unit in Cameroon corresponding to this desired population size is the "health area". There are 4089 health areas in Cameroon, grouped into 200 health districts, grouped into 10 regions.

Sampling was directed by the selection of urban clusters (health areas). Prior to sampling, all health areas in the Center and Littoral regions were classified into one of the two groups below. From a list of all health areas located in the health districts, stratified by classifications 1 and 2 below, health areas were selected with probability proportional to population size.

1. Health areas located in the 2 largest communes in the Center and Littoral regions (communes with special status: Yaoundé and Douala). These towns are also communes in which all the health districts where the health areas are located are classified as urban. Probability sampling proportional to the size of the urban health areas in these communes was carried out, and 16 urban health areas in Yaoundé and Douala were randomly selected for the census.
2. Double probability cluster sampling proportional to the size of the districts and health areas was carried out for all other health districts outside Yaoundé and Douala in the Center and Littoral regions. An initial random sample of eight health districts was drawn from the Center and Littoral health districts outside Yaoundé and Douala. Secondly, 40 health areas (mixed urban and rural) were randomly selected from these eight selected districts and included in the census.

All private for-profit health facilities, faith-based health facilities, pharmacies and informal vendors potentially oriented towards the sale of antimalarial drugs were approached for possible participation. Once the clusters had been selected, the lists of DPML-authorized pharmacies and private health facilities were used to estimate the number of outlets in the selected clusters. Additional pharmacies were selected in a booster sample by geographical area, from the official lists of pharmacies, until the required sample size was reached.

Sample size

A series of calculations was carried out to identify the minimum sample size requirements for consumer-level outlets needed to estimate key market indicators with a precision ≤ 10 percentage points in both regions and separately in urban and rural areas. Data on the composition of cluster outlets (health areas) come from a 2019 family planning study conducted in the Center and Littoral regions by the Association camerounaise pour le marketing social (ACMS), PSI's affiliate in Cameroon. A sample of 15 urban clusters, supplemented by additional pharmacies, yielded the

numbers of outlets selected and presented in the in Table 1. The sample sizes were sufficient to estimate the market indicators (as proportions) with at least the absolute level of precision shown in Table 1. The following formula and assumptions were used to estimate the number of outlets required:

$$n = \text{deff} \times \frac{[Z_{1-\alpha}^2 \times P(1 - P)]}{d^2}$$

with :

n = desired sample size (by urban/rural area and by outlet type)

P = assumption concerning the proportion of the population, equal to 0.5.

Z_{1- α} = normal value of standard deviation 1- α corresponding to an error α (type I) with a two-tailed test, equal to 1.96

d = the desired absolute precision of the estimate / half the width of the desired confidence interval, equal to 0.1.

deff = the sampling effect in the case of multi-stage sampling, equal to 2.

CPF = finite population correction, a correction applied to the sample size calculation when the size of the universe of is known (or assumed to be less than a given value) and the sample represents more than 5% of the universe. In this study, CPF is applied to sample size estimates for private for-profit health facilities, pharmacies and pro-pharmacies.

Type of outlet	Urban		Rural		Total	
	Number of interviews	Minimum absolute accuracy	Number of interviews	Minimum absolute accuracy	Number of interviews	Minimum absolute accuracy
Private health facilities	194	0.10	193	0.10	387	0.08
Pharmacies	100	0.12	0	-	100	0.12
Informal vendors	150	0.12	162	0.11	312	0.08
Total	443	0.07	355	0.08	798	0.05

Wholesaler sample size

Little is known about the number of formal pharmaceutical and medical wholesale companies in Cameroon. Based on ACTwatch's supply chain studies in Cameroon and Nigeria in 2009, each urban group selected in the point-of-sale survey generated two unique terminal wholesaler contacts. The study investigated the largest Cameroonian distribution companies based in Yaoundé and Douala, identified from contacts provided at lower levels of the supply chain, supplemented by targeted sampling where necessary. Cameroon has an active informal private sector and, based on previous work, it was expected that kiosks and market stalls would source goods from larger informal market stalls. The survey collected information from informal wholesalers where they were identified on the basis of contact details provided.

Collecting data

Outlet data collection

In each of the selected health areas, investigators counted all outlets with the potential to stock all kinds of antimalarials and diagnostic tests. To ensure that all outlets with the potential to sell or distribute antimalarials and diagnostic tests in the sampled health areas were visited, the following methods were used before and during data collection:

1. Once in the field, the supervisors went to see the head doctor of the zone (district or health area) to obtain his approval. For the census, contact was made with the competent local authority (health area or district chief) to find out where anti-malarial drugs are usually sold.
2. The research team provided interviewers with a list of all private and faith-based health facilities and pharmacies registered in the selected health area (and district).
3. After surveying the boundaries of each district or village in the health area with the help of district chiefs, the surveyors identified all outlets with the potential to store, sell and distribute anti-malarial drugs and tests.

For eligible outlets, the interviewers provided information on the study and asked to interview the manager or main pharmacist, as this person is in a position to provide reliable information on sales volumes. If there are several providers working in the outlet, the main provider was invited to complete the interview. If he/she was not available, the most senior manager was invited to complete the interview, with the authorization of the designated deputy if the latter was not the most senior manager. In all cases, the participant was interviewed in a discreet location away from colleagues and/or superiors. In each sales outlet and in each private and faith-based health facility visited, a salesperson or care provider was first approached to ask for his or her agreement to participate, using the information sheet and informed consent form. Once consent had been obtained, full details of each antimalarial drug available were collected using the drug audit form. Details for each type of RDT were also entered on the RDT audit form. If an outlet was closed or the provider was too busy, the interviewer returned at another time. A maximum of three visits were made to a given outlet; interviewers were encouraged to make an appointment on the same day as the initial visit, and at a time agreed with the provider. This reduced the time spent in a given locality.

Prior to data collection, initial lists of all private health facilities, faith-based health facilities, pharmacies and pro-pharmacies registered in the Cameroon regions were obtained from the Ministry of Health and the DPML. Key informants (district and village chiefs, notables, etc.) living or working in the health districts were also approached to verify and identify the outlets on the lists. Finally, a snowball sampling technique was used with providers to identify other outlets in the arrondissements. This snowballing technique took place at the same time as the point-of-sale survey.

Collection from wholesalers

General field procedures for wholesale outlets mirrored those for retail outlets. The same field team was responsible for interviewing both wholesalers and retailers. Once sampling and selection had been completed, wholesalers were approached by members of the field team, who presented the study to the company staff member responsible for malaria-related sales. Wholesalers were selected for inclusion by checking whether the establishment had antimalarials or RDTs in stock at the time of the interview or at any time in the 3 months prior to the interview.

Sampling weight

Sampling weights were applied to the analysis of the Camaroun 2024 point-of-sale survey data to account for variations in the probability of selection resulting from the sampling design:

- 1) Cluster sampling: Health areas were selected from sampling frames in each area with probability proportional to size. In each selected health area, a census of all outlets likely to sell or distribute antimalarials and/or provide malaria blood tests was carried out.
- 2) Recall sample: The geographical area for the point-of-sale census was extended to include neighbouring health areas (selected using a random method) for pharmacies and health facilities.

The sampling weights applied in the analysis are the inverse of the selection probability:

$$W_i = \frac{1}{a \times \frac{M_\alpha}{\sum M_\alpha}}$$

Where:

- M_α = Estimated cluster (population size)
- $\sum M_\alpha$ = Sum of estimated cluster sizes (population size) across the stratum
- a = Number of selected clusters in the stratum

Sampling weights are calculated at cluster level and applied to all outlets in a given cluster, regardless of outlet type.

Market share was calculated using complete census data at the level of the selected primary health area only (i.e., the booster sample was not included in the market share calculation). Health area sampling weights were created using the sampling weight formula (W_i), where :

M_a = Estimated population size of the health area
 ΣM_a = Sum of estimated health area population size across stratum
 a = Number of selected health areas in stratum

Health area sampling weights were applied to all other report indicators for all outlet types, with the exception of health facilities and pharmacies. Since these outlet types were included in the recall sample, the weights applied to these outlet types for all indicators other than market share were calculated using the sampling weight formula (W_i), where :

M_a = Estimate of the size of the communal population
 ΣM_a = Sum of estimated communal population size across stratum
 a = Number of selected communes in stratum

A sampling frame with population size was used to select the sample because there are no precise estimates of the total number of outlets per geographic or administrative unit that might be eligible for a survey of drug outlets. The main assumption used in the use of population figures for sampling and weighting is that the distribution of outlets and/or the distribution of drugs transiting through the outlets of a given group is correlated with the size of the population.

Finite population correction

A finite population correction (FPC) was applied to the study estimates to account for the high proportion of arrondissements and communes selected in the study without replacement. The CPF affects the standard errors of the estimates, but not the point estimates themselves.

		2 Point-of-sale staff refused before the selection was made can take place
		3 There is no eligible sponsor to complete the selection
		4 Point-of-sale staff ask us to come back more often late for selection
		9 6 Other reasons

canscreen_other <i>(required)</i>	2.3 Specify another reason : <i>Question relevant when: \${canscreen} =96</i>	
Section 2. Selection questions > 0 <i>Group relevant when: \${canscreen} =1</i>		
INST_start	Prompt: <i>Hello, my name is [c1b]. I work for the Association Camerounaise pour le Marketing Social, ACMS. We are conducting a study on the availability of anti-malarial drugs and malaria screening services in outlets like yours in Cameroon. The results will help us improve the availability of appropriate drugs and the treatment of malaria in Cameroon.</i> <i>I'd like to ask you a few questions to see if you can take part in this study. This is a study and you are under no obligation to participate as it is completely voluntary. I would also like to assure you that the answers you give will remain confidential. We will not share your information with the authorities, and you will not have to fear any reprisals.</i> <i>Question relevant when: \${formtype} !=3</i>	
s3 <i>(required)</i>	2.4 Do you have any anti-malarial drugs in stock today?	1 Yes 0 No
s4 <i>(required)</i>	2.5 Are there any antimalarial drugs that are sold out today, but that you've had in stock for the past 3 months? <i>Question relevant when: selected(\${s3} , '0')</i>	1 Yes 0 No 9 Don't know 8 9 Not applicable for this type of point of sale 9
s5a <i>(required)</i>	2.6 Is microscopic malaria screening available here today? <i>Question relevant when: \${formtype} !=2</i>	1 Yes 0 No
s5b <i>(required)</i>	2.7 Do you have malaria rapid diagnostic tests (RDTs) in stock today? <i>If you're asked what an RDT is, explain: a malaria rapid diagnostic test, also known as an RDT, is a small, individually packaged blood test that quickly diagnoses whether a person has malaria.</i>	1 Yes 0 No
s6 <i>(required)</i>	2.8 Have you stocked malaria rapid diagnostic tests (RDTs) in the last 3 months? <i>If you're asked what an RDT is, explain: a malaria rapid diagnostic test, also known as an RDT, is a small, individually packaged blood test that quickly</i>	1 Yes 0 No 9 Don't know 8 9 Not applicable for this type of 9

n1 (required)	6.1 Drug audit <i>Interviewer: Show the photo catalog of antimalarials and ask to see the full range of antimalarials that the outlet/company currently stocks.</i> Confirm the presence of at least one anti-malarial drug in this outlet/company.	1	Yes
		0	No
n2 (required)	6.2 In the pre-screening phase of this interview, the provider has indicated that antimalarials are present. Please confirm that the provider has no products physically available, or indicate here why there is a difference in answers, e.g. the provider doesn't want to show them to us, etc. Otherwise, return to the previous question, change your answer and continue the audit. Question relevant when: selected(\${n1}, '0')	1	Yes, I can confirm that there is NO of antimalarial drugs present
		2	The provider refused to show the antimalarial drugs present
		9	Other reasons
n2_other (required)	6.3 Specify other reason: Question relevant when: selected(\${n2}, '96')	6	

n3	<p>Interviewer:</p> <p><i>Audit antimalarial drugs</i></p> <p><i>Instructions:</i></p> <p><i>(1) Collect one copy of every antimalarial available.</i></p> <p><i>(2) Proceed with the audit by swiping forward and selecting "Add a group".</i></p> <p><i>(3) Answer all questions and add new groups for each different product. Question relevant when: selected(\${n1}, '1')</i></p>

rdt_instructions	Diagnostic audit Investigator: The following questions aim to audit the availability of malaria tests. Answer a series of questions about test equipment and microscopy services, then carry out an audit of all RDTs in stock in this outlet/company.		
d1 (required)	7.1 D1. Does this facility now have disposable gloves that staff can use when meeting customers/patients?	1 0 9 8 9	Yes No Don't know Not applicable for this type of point of sale
d2 (required)	7.2 D2. Does this facility have a sharps disposal box or safety box available to staff today?	1 0 9 8 9	Yes No Don't know Not applicable for this type of point of sale
d3 (required)	7.3 D3. Is microscopic malaria screening available here today?	1 0	Yes No
d3b (required)	7.4 In the pre-screening phase of this interview, the provider indicated that malaria microscopy screening is available here today. Please confirm with the provider that malaria microscopy screening is available, or return to the previous question, change your answer and continue the audit. <i>Question relevant when: selected(\${d3} , '0') and \${micro_stockcurrent} =1</i>	1	Yes, I confirm that microscopic malaria screening is NOT available
d4 (required)	7.5 D4. How many malaria microscopy tests has this establishment performed in the last 7 days? <i>Question relevant when: selected(\${d3} , '1')</i> <i>Response constrained to: (.>=0 and .<=1000000) or .=-9888 or .=-9777</i>		
d4_WARN	Interviewer: Confirm that [d4] is the correct number of people tested before continuing. Question relevant when: \${d4} >=50 and not(\${d4} =998)		

Field	Question	Answer
d5 (required)	7.6 D5. What is the total cost of a microscopic examination for an adult? FCFA Question relevant when: selected(\${d3} , '1') Response constrained to: (.>=0 and .<=1000000) or .=-9888 or .=-9777	
d5_WARN	Interviewer: Confirm that [d5] is the correct cost of an adult microscopy test before proceeding. Question relevant when: \${d5} >=5000	
d6 (required)	7.7 D6. What is the total cost of a microscopic examination for a child under 5? FCFA Question relevant when: selected(\${d3} , '1') Response constrained to: (.>=0 and .<=1000000) or .=-9888 or .=-9777	
d6_WARN	Interviewer: Confirm [d6] is the correct cost of a microscopy test for children under 5 before proceeding. Question relevant when: \${d6} >=5000	
d7 (required)	7.8 Interviewer: Interviewer: Show the RDT photo catalog and ask to see the full range of RDTs the outlet/company currently stocks. Confirm the presence of at least one RDT in this outlet/company: Show the entire list using the photo catalog. E.g. - Bioline - SD Bioline (Standard Diagnostic Bioline) - DiaSpot - ParaCheck - Parasight - CareStart - First response Question relevant when: \${rdt_stock} =1	1 Yes 0 No
d8 (required)	7.9 In the pre-screening phase of this interview, the provider has indicated that TORs are present. Please confirm that the provider has no products physically available, or indicate here why there is a difference in answers, e.g. the provider doesn't want to show them to us, etc. Otherwise, return to the previous question, change your answer and continue the audit. Question relevant when: selected(\${d7} , '0') and \${rdt_stock} =1	1 I can confirm that there are NO RDTs present 2 The provider refused to show RDTs present 9 Other reasons 6
d8_other	8.9b Specify another reason : Question relevant when: \${d8} =96	

rdtAudit_instructions	<p>Interviewer:</p> <p><i>Audit the RDT.</i></p> <p>Instructions:</p> <p>(1) Collect one copy of each RDT available.</p> <p>(2) Proceed with the audit by swiping forward and selecting "Add a group".</p> <p>(3) Answer all questions and add new groups for each different product. Question relevant when: selected(\${d7}, '1')</p>

Questions	Terms and conditions
1. Stored products (Anti-malarials)	
1.1. Which 10 antimalarial products do you regularly import? <i>Please provide brand name, generic name and presentation</i>	1) _____ 2) _____ 3) _____ 4) _____ 5) _____ 6) _____ 7) _____ 8) _____ 9) _____ 10) _____
1.2. What are the top 10 antimalarial products you sell in terms of volume? <i>Please provide brand name, generic name and presentation</i>	1) _____ 2) _____ 3) _____ 4) _____ 5) _____ 6) _____ 7) _____ 8) _____ 9) _____ 10) _____
2. Pricing (Anti-malarial drugs)	
2.1. What is your approximate average margin (XAF)?	_____
2.2. Do your margins vary according to the type of antimalarial?	_ Yes _ No
2.3 Which antimalarial product has the highest margin?	_____
2.4. Which antimalarial product has the lowest margin?	_____
3. Stocked products (RDTs)	
What RDT products do you regularly import?	1) _____ 2) _____ 3) _____ 4) _____ 5) _____
What are the best-selling RDTs in terms of volume?	1) _____ 2) _____ 3) _____ 4) _____ 5) _____
4. Pricing (RDTs)	
What is your approximate average margin (XAF)?	_____
Which RTD product has the highest margin?	_____
Which RTD product has the lowest margin?	_____
5. Distribution network and practices	
5.1. Does this company have its own distribution centers or wholesalers in Cameroon, i.e., branches?	_ Yes _ No
5.2. How much will it cost?	_ _ _
5.3. Where are they located? <i>Gather information on the location of the city/town for follow-up visits</i>	1) _____ 2) _____ 3) _____ 4) _____ 5) _____
5.4. What is the size and coverage of your distribution network to distributors and wholesalers outside the company network? <i>For example, how many regions do you cover? How many regions do you cover?</i>	_ _
5.5. Where are the other customers located?	1) _____ 2) _____

Questions	Terms and conditions
	3) _____ 4) _____ 5) _____
5.6. How many customers do you have in total?	_ _ _ _ _
5.7. What proportion of anti-malarial sales volumes is distributed through your own company's network? (<i>compared with other drug products</i>)	_ _ _ _ %
5.8. What proportion of RDT sales volumes is distributed by your own company network? (<i>compared with other diagnostic tests</i>)	_ _ _ _ %
6. Sales revenue	
What is the company's approximate gross monthly sales (XAF)?	_ _ _ _ _ _ _ _ _ _ _ _ _ _ _
What percentage of this revenue comes from the sale of anti-malarial drugs?	_ _ _ _ %
What percentage of this revenue comes from the sale of RDTs?	_ _ _ _ %

In this interview, I'd like to discuss the anti-malarial and rapid diagnostic test (RDT) aspects of your business. As we move through the interview topics, we can first discuss the link with antimalarials, then with RDTs.

1) Introduction

- a) Can you tell me a bit about yourself and your role in the company?

Let's start by talking about antimalarial drugs:

2) Stored products (Anti-malarials)

Gather current product list from respondent, if available

- a) Do you have exclusive import agreements for certain brands of antimalarial drugs?
i) Which brands?
b) How do you decide which other antimalarial products to stock?
c) What are the usual import deadlines?
i) Do these timescales vary greatly depending on the brand or manufacturer?

3) Pricing (Anti-malarials)

- a) How do you decide on the sale price of anti-malarial products?
b) Do you ever vary your selling price for a given product?
i) What are the reasons for this?
Prompt: Do prices vary according to order volume or customer type?

We will now talk about malaria RDTs:

4) Stocked products (RDTs)

Gather current product list from respondent, if available

- a) Do you have exclusive import agreements for certain RDT brands?
i) Which brands?
b) How do you decide which other RDT products to stock?
c) What are the usual import deadlines?
i) Do these lead times vary greatly from one manufacturer to another?

5) Pricing (RDTs)

- a) How do you decide which selling prices to apply to RDTs?
b) Do you ever vary your selling price for a given product?
i) What are the reasons for this?
Prompt: Do prices vary according to order volume or customer type?

We will now talk about commercial operations in general:

6) Distribution network and practices

- a)
i) Can you describe your distribution system?
Prompt: number and frequency of delivery routes to distribution centers, in-house or third-party logistics ?
b)
i) Do you distribute products to customers, or do they pick them up from you?
If the company makes deliveries: Can you describe your distribution system for these customers?
c) Do you have minimum order requirements for wholesale customers outside your corporate network? What are the terms?
Prompt: depending on minimum total price, minimum quantity, other conditions.
Note if there are differences for antimalarials and RDTs
d) Are there any differences in the number of distribution points or customers for RDTs compared with antimalarials?
If yes: Please describe these differences.

7) Competition

- a) Who do you see as your main commercial competitors for antimalarial drugs?
i) What makes these companies your competitors?
b) How do you attract antimalarial customers to your company?
c) Why do you think some customers choose other companies over yours?
d) Are there any means of cooperation between companies at your level?
Prompt: trade associations, price agreements, agreements on geographic concentration

- e) Does the company have different competitors for RDTs?
Ask the questions above and document any differences in answers for the RDTs.

8) Information sources

- a) How do you get information about antimalarial products?
b) How do you get information about RDTs products?

9) Sales revenue

- a) At what time of year is total income highest?
i) When is it at its lowest?
b) How does the contribution of antimalarials to total income vary over the year?
c) How does the contribution of RDTs to total income vary over the year?

10) Regulations

- a) What is your opinion on the regulatory requirements for this type of business?
i) Do you think they're reasonable? If not, why not?
ii) How do they influence the way you run your business?

b) What do you think of the regulators' ability to enforce their regulations?
i) Do you think most companies comply with the regulations?
ii) Do you think sanctions are applied?
iii) Have you had any personal experiences in your dealings with regulatory authorities? Can you describe them?

c) Would you like to see changes in the regulatory system?
i) What would you like to see changed?

d) With specific reference to anti-malarial drugs, what do you know about the operation of the parallel market in unofficial imports and smuggling in this country?
i) How do you think the parallel market has changed in recent years?

11) Suggestions

- a) What is the biggest risk or challenge you face when it comes to anti-malarial drugs in your company?
i) What can be done about it?
b) Is there anything else you'd like to tell me about your experience with anti-malarial drugs?
c) Now, with regard to the RDT, what is the biggest risk or challenge you face with regard to the RDT?
i) What can be done about it?
d) Is there anything else you'd like to tell me about your RDT experience?

12) Wrap-up and questions from the respondent

Thank you for your time today.

- a) Before we finish, is there anything else you'd like to raise or discuss about these topics?
b) Do you have any questions for me?

APPENDIX 6: DEFINITIONS OF KEY INDICATORS

Table 1: Availability of antimalarials among all outlets surveyed

Table 1 shows the proportion of all outlets counted that had antimalarials in stock at the time of the survey visit. The availability of antimalarials is reported for all outlets, as well as for the different types of outlet. Availability is reported for all antimalarial drugs, as well as for specific types of antimalarial drugs.

Numerator	Number of outlets with an antimalarial drug in stock at the time of the survey visit, confirmed by the presence of at least one antimalarial drug (defined as a drug containing antimalarial components) recorded in the antimalarial verification section.
Denominator	Number of outlets surveyed.
Calculation	Numerator divided by denominator.
Handling missing values	All filtered outlets will contribute to the denominator. This includes outlets that were eligible for an interview (including a malaria check), but: 1) were not interviewed; or 2) the interview was only partially completed.
Notes and considerations	Given the partial completion or non-completion of interviews among eligible outlets, and the inclusion of these outlets in the denominator, these availability indicators can be considered as conservative estimates of antimalarial availability.

Table 2: Availability of antimalarial drugs among outlets stocking at least one antimalarial drug

Table 2 shows the proportion of antimalarial stockists with specific antimalarials in stock at the time of the survey visit. The availability of antimalarials is reported for all outlets, as well as for the different types of outlet. Availability is reported for all anti-malarial drugs as well as for specific types of anti-malarial drugs.

Numerator	Number of outlets with an antimalarial drug in stock at the time of the survey visit, confirmed by the presence of at least one antimalarial drug (defined as a drug containing antimalarial components) recorded in the antimalarial verification section.
Denominator	Number of outlets with at least 1 antimalarial audited.
Calculation	Numerator divided by denominator.
Handling missing values	All outlets with at least one antimalarial recorded in the antimalarial audit sheet will contribute to the denominator. This includes outlets where the interview was not fully completed (partial interview).
Notes and considerations	Given the partial completion of interviews with outlets stocking anti-malarial drugs, and the inclusion of these outlets in the denominator, these availability indicators can be considered as conservative estimates of anti-malarial drug availability.

Table 3: Availability of malaria blood tests at anti-malarial stocking points

Table 6 shows the proportion of antimalarial stockists who had antimalarial blood tests available. Test availability is reported for all outlets, as well as for each type of outlet. Availability is reported for all blood tests, as well as for specific types of test: microscopy and rapid diagnostic tests (RDTs), including prequalified RDTs.

Numerator	Number of outlets with blood malaria screening available (all, microscopy, RDT, prequalified RDT).
Denominator	Part 1: Number of eligible outlets Part 2: Number of outlets with antimalarials in stock at the time of the survey visit, or which had stocked antimalarials in the previous three months.
Calculation	Numerator divided by denominator.
Handling missing values	<ul style="list-style-type: none"> Antimalarial stocking points for which information on the availability of microscopy and RDTs is lacking are excluded from the malaria screening indicators. The number of such outlets is indicated in a footnote. Outlets offering partial information on the availability of blood tests (microcopy or RDT information) are included in the denominator of the "any available blood test" indicator. The number of such outlets is indicated in a footnote. The RDT and microscopy availability indicators respectively exclude outlets for which information on availability is missing (i.e. outlets lacking information on microscopy availability are excluded from the microscopy indicator).

Table 4: Composition of the anti-malarial drugs market

Table 3 shows the distribution of outlet types among outlets with at least one antimalarial in stock on the day of the survey.

Numerator	By type of outlet, the number of outlets with an antimalarial in stock at the time of the survey visit, confirmed by the presence of at least one antimalarial (defined as a drug containing antimalarial components) recorded in the antimalarial verification section.
Denominator	Total number of outlets with an antimalarial drug in stock at the time of the survey visit, confirmed by the presence of at least one antimalarial drug (defined as a drug containing antimalarial ingredients) recorded in the antimalarial verification section.
Calculation	Numerator for each catch type divided by the denominator.
Handling missing values	All outlets with at least one anti-malarial registered in the anti-malarial audit sheet will contribute to the indicator. This includes outlets where the interview has not been fully completed (partial interview).
Notes and considerations	Market composition is calculated among outlets located in the representative cluster sample and excludes the booster sample.

Table 5: Prices of antimalarial drugs

Table 5a shows the median price of an adult equivalent treatment dose (AETD, see Appendix 9) for selected types of antimalarial tablets for all output types. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	Median price of antimalarial AETD (see appendix 9) in US dollars with inter-quartile range (25th and 75th percentiles).
Handling missing values	Anti-malarials for which price information is missing are excluded from the median price calculation.
Notes and considerations	The price in US dollars is calculated on the basis of exchange rates available from www.oanda.com using the historical exchange rates tool. The average exchange rate over the entire data collection period is used to convert the local currency entered at the time of data collection into US dollars.

Table 6: Prices of antimalarial drugs

Table 6 shows the median price of pre-packaged ACT AQ therapies: pediatric appropriate for a 10 kg child (2 years), child (15-25 kg), adolescent (25-35 kg) and adult appropriate for a 60 kg adult. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	Median price of pre-packaged treatment in US dollars with inter-quartile range (25th and 75th percentiles).
Handling missing values	Anti-malarials for which price information is missing are excluded from the median price calculation.
Notes and considerations	The price in US dollars is calculated on the basis of exchange rates available from www.oanda.com using the historical exchange rates tool. The average exchange rate over the entire data collection period is used to convert the local currency entered at the time of data collection into US dollars.

Tables 7 and 8: Profit margins

Table 7 shows the median percentage profit per AETD, while Table 8 shows the median percentage profit for prepackaged antimalarial tablet formulation types for all outlet types. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	The profit percentage is calculated for each antimalarial by dividing the difference between the retail price and the wholesale price by the wholesale price. The median is then indicated for each type of antimalarial in each type of outlet.
Handling missing values	Antimalarials for which information on retail or wholesale purchase prices is missing are excluded from the median price calculation. Antimalarials for which profits have been negative are excluded from this calculation.
Notes and considerations	The price in US dollars is calculated on the basis of exchange rates available from www.oanda.com using the historical exchange rates tool. The average exchange rate over the entire data collection period is used to convert the local currency entered at the time of data collection into US dollars.

Tables 9 and 10: Profit margins

Table 9 shows the median absolute benefit values per AETD, while Table 10 shows the median absolute benefit for prepackaged tablet antimalarial types for all outlet types. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	Absolute profit is calculated for each antimalarial by calculating the difference between the retail price and the wholesale price. The median is then indicated for each type of antimalarial in each type of outlet.
-------------	--

Handling missing values	Antimalarials for which information on retail or wholesale purchase prices is missing are excluded from the median price calculation. Antimalarials with a negative difference are excluded from this calculation.
Notes and considerations	The price in US dollars is calculated on the basis of exchange rates available from www.oanda.com using the historical exchange rates tool. The average exchange rate over the entire data collection period is used to convert the local currency entered at the time of data collection into US dollars.

Table 11: Median sales volumes

Table 11 shows the median number of certain types of antimalarial tablet formulations and mRDTs sold in the previous week for all outlet types. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	AETD sales volumes by product type are calculated, and the median is then reported by type of antimalarial in each type of outlet.
Handling missing values	Anti-malarial drugs for which information on sales volume is lacking are excluded from this calculation.

Table 12: Median sales volumes among outlets with sales

Table 12 shows the median number of certain types of antimalarial tablet formulations and mRDTs sold in the previous week across all outlet types for outlets reporting sales. The interquartile range (IQR) is provided as a measure of dispersion.

Calculation	AETD sales volumes by product type are calculated, and the median is then reported by antimalarial type in each outlet type if the outlet's overall sales volume in the previous week was greater than zero.
Handling missing values	Anti-malarial drugs for which information on sales volume is lacking are excluded from this calculation.

Table 13: Market share of antimalarial drugs

Antimalarial market share is the quantity of adult treatment equivalent doses (AETDs) reported to have been sold/distributed in the previous week, by outlet type and antimalarial drug type, as a percentage of all AETDs sold/distributed in the previous week. Expressed as a percentage, market share is the quantity of a specific antimalarial sold/distributed by a specific type of outlet relative to the total antimalarial market (all types of antimalarial sold/distributed by all types of outlet). Totals are shown by type of antimalarial drug and type of outlet. For all anti-malarial drug types and outlet types, the percentages in the overall table add up to 100% (the total market).

Numerator	Number of AETDs sold/distributed for a specific antimalarial drug category and outlet type.
Denominator	Total number of AETDs sold/distributed.
Calculation	Numerator divided by denominator.
Handling missing values	DEAM sold/distributed is calculated among audited drugs with complete and consistent information. Anti-malarials with incomplete or inconsistent information among the key variables that define DEAM sold/distributed (active ingredients, concentration, formulation, pack size, quantity sold/distributed) are excluded from the calculation.

Notes and considerations	See Appendix 9 for a description of the AETD calculation.
--------------------------	---

Table 14: Market share of antimalarials by type of outlet

Antimalarial market share for all outlet types is the quantity of adult treatment equivalent doses (AETDs) reportedly sold/distributed in the previous week by antimalarial type in each outlet type, as a percentage of all AETDs sold/distributed in the previous week in the specified outlet type. Expressed as a percentage, the outlet type's market share is the quantity of a specific antimalarial sold/distributed relative to the entire antimalarial market segment for the specified outlet type (all antimalarial types sold/distributed by the specific outlet type). Totals are reported by anti-malarial drug type for each outlet type. For all anti-malarial drug types in each outlet type, the sum of the percentages is 100%.

Numerator	Number of AETDs sold/distributed for a specific category of antimalarial drugs in the type of outlet specified.
Denominator	Total number of AETD sold/distributed in the specific outlet type.
Calculation	Numerator divided by denominator.
Handling missing values	DEAM sold/distributed is calculated among audited drugs with complete and consistent information. Anti-malarials with incomplete or inconsistent information among the key variables that define DEAM sold/distributed (active ingredients, concentration, formulation, pack size, quantity sold/distributed) are excluded from the calculation.
Notes and considerations	See Appendix 9 for a description of the AETD calculation.

Table 15: Market share of malaria screening blood tests

Malaria blood test market share is the number of malaria blood tests reportedly sold or distributed in the previous week by outlet type and malaria blood test type (RDT, microscopy) as a percentage of all malaria blood tests sold/distributed in the previous week. Expressed as a percentage, market share is the number of a specific type of malaria blood test sold by a specific type of outlet relative to the total malaria blood test market (all malaria blood tests sold / distributed by all types of outlet). Totals are shown by test type and by outlet type. For all malaria blood test types and outlet types, the percentages in the overall table add up to 100% (the total market).

Numerator	Number of malaria blood tests sold/distributed for a specific type of blood test (RDT, microscopy) and type of output.
Denominator	Total number of malaria blood tests sold/distributed.
Calculation	Numerator divided by denominator.
Handling missing values	Malaria blood tests sold/distributed are calculated between RDTs and microscopy services verified with complete and consistent information. RDTs and microscopy services with incomplete or inconsistent information on the quantity sold/distributed) are excluded from the calculation.
Notes and considerations	Records and/or recalls of microscopy tests versus malaria RDTs may differ within a given outlet, introducing an unquantifiable bias into the estimate of the total number of tests performed.

Table 16: Market share of malaria blood tests by type of outlet

Market share of malaria blood tests by outlet type is the number of malaria blood tests that would have been sold or distributed in the previous week by blood test type in each outlet type, as a percentage of all blood tests sold / distributed in the previous week in the specified outlet type. Expressed as a percentage, the outlet type's market share is the quantity of a specific malaria blood test sold / distributed relative to the entire blood test market segment for the specified outlet type (all malaria tests sold / distributed by the specific outlet type). Totals are reported by test type for each outlet type. For all malaria blood test types in each outlet type, percentages add up to 100%.

The market share of each RDT manufacturer is also reported by outlet type. Within each outlet type, the number of RDTs sold or distributed for a given manufacturer relative to all RDTs distributed in that outlet type is expressed as a percentage. Totals for RDT market share in all manufacturer sums at 100% in each outlet type.

Numerator	Number of malaria blood tests sold/distributed for a specific type of blood test (RDT, microscopy) or number of malaria RDTs sold/distributed for a specific manufacturer, in the type of outlet specified.
Denominator	Total number of malaria blood tests / RDTs sold / distributed in the specific outlet type.
Calculation	Numerator divided by denominator.
Handling missing values	Malaria blood tests sold/distributed are calculated between RDTs and microscopy services verified with complete and consistent information. RDTs and microscopy services with incomplete or inconsistent information on the quantity sold/distributed) are excluded from the calculation.
Notes and considerations	Records and/or recalls of microscopy tests versus malaria RDTs may differ within a given outlet, introducing an unquantifiable bias into the estimate of the total number of tests performed.

APPENDIX 7: AETD (ADULT EQUIVALENT TREATMENT DOSE)

Definition

Antimalarial drugs are manufactured from a variety of active pharmaceutical ingredients, dosage forms, strengths and pack sizes. ACTwatch uses the adult equivalent treatment dose (AETD) as the standard unit for pricing and sales/distribution analyses. An AETD is defined as the number of milligrams (mg) of an antimalarial drug required to treat an adult weighing 60 kilograms (kg). For each generic antimalarial drug, the AETD is defined as the number of mg recommended in the WHO guidelines for the treatment of uncomplicated malaria in areas of low drug resistance. Where the WHO treatment guidelines do not cover a specific generic, AETD is defined on the basis of peer-reviewed research or the treatment recommended by the product manufacturer for a 60 kg adult. Table X9 lists the definitions of AETD used in this report.

While it is recognized that the use of AETDs can oversimplify and ignore many of the complexities of drug consumption and utilization, this analytical approach has been chosen because it standardizes drug dosages across drug types and across countries (which can sometimes vary), thus enabling comparisons on prices and volumes calculated on the basis of an AETD.

Additional considerations :

- When combination therapies consist of two or more active antimalarial ingredients packaged together (co-formulated or co-blistered), the concentration of a single main ingredient is issued. Artemisinin derivative is used as the main ingredient for ACT AETD calculations.
- Co-cloned combinations are generally assumed to be a 1:1 ratio of tablets, unless otherwise specified during fieldwork or on manufacturers' websites.
- Sulfamethoxypyrazine-pyrimethamine is assumed to deliver the same full adult dose as sulfadoxine-pyrimethamine.

Calculation

Information collected on the drug concentration and unit size indicated on the product packaging was used to calculate the total quantity of each active ingredient found in the package. The number of AETDs in a unit was calculated.⁶ The number of AETDs in a monotherapy is calculated by dividing the total amount of active ingredient in the unit by the AETD (i.e. the total number of mg required to treat a 60 kg adult). The number of AETDs for combination therapy is calculated by dividing the total quantity of active ingredient used as the basis for the AETD by the AETD.

⁶ The unit depends on the dosage form of the drug. The unit for antimalarials in tablet, suppository or granule form is the pack. The unit for injectable antimalarials is the ampoule. The unit for anti-malarial syrups and suspensions is the bottle.

Definition: Adult Treatment Equivalent Dosage (ATED)

Antimalarial Generic [Ingredient used for the dose in mg of AETD].	Dose used to calculate 1 AETD (mg required to treat a 60 kg adult)	Source
Amodiaquine	1800mg	WHO model form, 2008
Artemether	960mg	WHO use of antimalarial drugs, 2001 Note: this includes a recommended loading dose of 4 mg / kg on the first day, followed by a six-day course of 2 mg / kg once daily.
Artemether-Lumefantrine [Artemether]	480mg	WHO malaria treatment guidelines 3rd edition, 2015
Artemisinin-Naphthoquine [Artemisinin]	2400mg	WHO use of antimalarial drugs, 2001
Artemisinin - Piperaquine [Artemisinin]	504mg	Thanh NX, Trung TN, Phong NC et al. 2012. Efficacy and tolerability of artemisinin-piperaquine (Artequick®) versus artesunate-amodiaquine (Coarsucam™) for the treatment of uncomplicated Plasmodium falciparum malaria in south-central Vietnam. Malaria Journal, 11 :217.
Arterolane- Piperaquine [Arterolane]	450mg	Patil C, Katare S, Baig M, Doifode S. Fixed-dose combination of arterolane and piperaquine: a new perspective in antimalarial treatment. Ann Med Health Sci Res. 2014 Jul; 4(4):466-71. doi: 10.4103/2141-9248.139270
Artesunate	960mg	WHO use of antimalarial drugs, 2001 Note: this includes a recommended loading dose of 4 mg / kg on the first day, followed by a six-day course of 2 mg / kg once daily.
Artesunate-Amodiaquine [Artesunate]	600mg	WHO malaria treatment guidelines 3rd edition, 2015
Artesunate-Mefloquine [Artesunate]	600mg	WHO malaria treatment guidelines 3rd edition, 2015
Artesunate- Sulfadoxine- Pyrimethamine [Artesunate]	600mg	WHO malaria treatment guidelines 3rd edition, 2015
Atovaquone-Proguanil [Atovaquone]	3000mg	WHO malaria treatment guidelines 3rd edition, 2015
Chloroquine	1500mg	WHO malaria treatment guidelines 3rd edition, 2015
Dihydroartemisinin- piperaquine [Dihydroartemisinin].	360mg	WHO malaria treatment guidelines 3rd edition, 2015 Note: AETD under the new 2015 guidelines is now 480 mg, whereas 360 mg was indicated in the previous guidelines. Product availability for prepackaged adult DHA PPQ in 2015 was still most often 360 mg administered over a 3-day cycle on a total of 9 tablets (40/320).
Dihydroartemisinin- Piperazine-Trimethoprim [Dihydroartemisinin].	256mg	Manufacturer's guidelines (Artecxin - Medicare Pharma; Artecom - Ctonghe)
Dihydroartemisinin- sulfadoxine-pyrimethamine [Dihydroartemisinin].	360mg	Manufacturer's guidelines (Dalasin - Adams Pharma)
Hydroxychloroquine	2000mg	Manufacturer's guidelines (Plaquenil - Sanofi Aventis)
Mefloquine	1000mg	WHO model form, 2008
Quinine	10408mg	WHO model form, 2008
Sulfadoxine-pyrimethamine	1500mg	WHO model form, 2008

APPENDIX 8: VOLUME OF ANTIMALARIAL DRUGS DISTRIBUTED

Market share of antimalarial drugs - total market

* AETD - Adult Equivalent Treatment Dose - is the number of milligrams needed to treat a 60 kg adult (see Appendix 9: AETDs).
Information provided by the respondent on the price of a specific quantity of antimalarial (for example, price per tablet or price per pack) has been converted into a price by AETD.
Pricing data in this table is derived from audited products for which pricing information has been provided. Footnote:
N outlets that met the selection criteria for a full interview but did not complete the interview (were not interviewed or completed a partial interview) = 252; N antimalarial products audited but price information missing = 435# ACT on the national registration list
^ ACT on the WHO prequalification list

Source: ACTwatch Lite survey, CAMEROON, 2024

Table X2 Purchase price in USD of antimalarials and RDTs in prepackaged form at surveyed outlets, by type of outlet

	Type of outlet						
	Private not-for-profit facilities	Private for-profit facilities	Pharmacy	Formal sector (total)	Informal sector	Total	Distributor
	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)	Median FCFA [IQR] (N of antimalarials)
